

LM555 Single Timer

Features

- High-Current Drive Capability: 200 mA
- Adjustable Duty Cycle
- Temperature Stability of 0.005%/°C
- Timing From μ s to Hours
- Turn off Time Less Than 2 μ s

Applications

- Precision Timing
- Pulse Generation
- Delay Generation
- Sequential Timing

Description

The LM555 is a highly stable controller capable of producing accurate timing pulses. With a monostable operation, the delay is controlled by one external resistor and one capacitor. With astable operation, the frequency and duty cycle are accurately controlled by two external resistors and one capacitor.

8-DIP

8-SOIC

Ordering Information

| Part Number | Operating Temperature Range | Top Mark | Package | Packing Method |
|-------------|-----------------------------|----------|---------|----------------|

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. Values are at $T_A = 25^\circ\text{C}$ unless otherwise noted.

| Symbol | Parameter | Value | Unit |
|------------|----------------------------------|------------|------------------|
| V_{CC} | Supply Voltage | 16 | V |
| T_{LEAD} | Lead Temperature (Soldering 10s) | 300 | $^\circ\text{C}$ |
| P_D | Power Dissipation | 600 | mW |
| T_{OPR} | Operating Temperature Range | 0 ~ +70 | $^\circ\text{C}$ |
| T_{STG} | Storage Temperature Range | -65 ~ +150 | $^\circ\text{C}$ |

Electrical Characteristics

Values are at $T_A = 25^\circ\text{C}$, $V_{CC} = 5 \sim 15\text{ V}$ unless otherwise specified.

| Parameter | Symbol | Conditions | Min. | Typ. | Max. | Unit |
|---|----------------------------|--|-------|-------|------|------------------------|
| Supply Voltage | V_{CC} | | 4.5 | | 16.0 | V |
| Supply Current (Low Stable) ⁽¹⁾ | I_{CC} | $V_{CC} = 5\text{ V}, R_L = \infty$ | | 3 | 6 | mA |
| | | $V_{CC} = 15\text{ V}, R_L = \infty$ | | 7.5 | 15.0 | mA |
| Timing Error (Monostable) Initial Accuracy ⁽²⁾ | ACCUR | $R_A = 1\text{ k}\Omega$ to $100\text{ k}\Omega$ $C = 0.1\text{ }\mu\text{F}$ | | 1.0 | 3.0 | % |
| Drift with Temperature ⁽³⁾ | $\Delta t / \Delta T$ | | | 50 | | ppm / $^\circ\text{C}$ |
| Drift with Supply Voltage ⁽³⁾ | $\Delta t / \Delta V_{CC}$ | | | 0.1 | 0.5 | % / V |
| Timing Error (Astable) Initial Accuracy ⁽²⁾ | ACCUR | $R_A = 1\text{ k}\Omega$ to $100\text{ k}\Omega$ $C = 0.1\text{ }\mu\text{F}$ | | 2.25 | | % |
| Drift with Temperature ⁽³⁾ | $\Delta t / \Delta T$ | | | 150 | | ppm / $^\circ\text{C}$ |
| Drift with Supply Voltage ⁽³⁾ | $\Delta t / \Delta V_{CC}$ | | | 0.3 | | % / V |
| Control Voltage | V_C | $V_{CC} = 15\text{ V}$ | 9.0 | 10.0 | 11.0 | V |
| | | $V_{CC} = 5\text{ V}$ | 2.60 | 3.33 | 4.00 | V |
| Threshold Voltage | V_{TH} | $V_{CC} = 15\text{ V}$ | | 10.0 | | V |
| | | $V_{CC} = 5\text{ V}$ | | 3.33 | | V |
| Threshold Current ⁽⁴⁾ | I_{TH} | | | 0.10 | 0.25 | μA |
| Trigger Voltage | V_{TR} | $V_{CC} = 5\text{ V}$ | 1.10 | 1.67 | 2.20 | V |
| | | $V_{CC} = 15\text{ V}$ | 4.5 | 5.0 | 5.6 | V |
| Trigger Current | I_{TR} | $V_{TR} = 0\text{ V}$ | | 0.01 | 2.00 | μA |
| Reset Voltage | V_{RST} | | 0.4 | 0.7 | 1.0 | V |
| Reset Current | I_{RST} | | | 0.1 | 0.4 | mA |
| Low Output Voltage | V_{OL} | $V_{CC} = 15\text{ V}$, $I_{SINK} = 10\text{ mA}$ | | 0.06 | 0.25 | V |
| | | $V_{CC} = 15\text{ V}$, $I_{SINK} = 50\text{ mA}$ | | 0.30 | 0.75 | V |
| | | $V_{CC} = 5\text{ V}$, $I_{SINK} = 5\text{ mA}$ | | 0.05 | 0.35 | V |
| High Output Voltage | V_{OH} | $V_{CC} = 15\text{ V}$, $I_{SOURCE} = 200\text{ mA}$ | | 12.5 | | V |
| | | $V_{CC} = 15\text{ V}$, $I_{SOURCE} = 100\text{ mA}$ | 12.75 | 13.30 | | V |
| | | $V_{CC} = 5\text{ V}$, $I_{SOURCE} = 100\text{ mA}$ | 2.75 | 3.30 | | V |
| Rise Time of Output ⁽³⁾ | t_R | | | 100 | | ns |
| Fall Time of Output ⁽³⁾ | t_F | | | 100 | | ns |
| Discharge Leakage Current | I_{LKG} | | | 20 | 100 | nA |

Notes:

- When the output is high, the supply current is typically 1 mA less than at $V_{CC} = 5\text{ V}$.
- Tested at $V_{CC} = 5.0\text{ V}$ and $V_{CC} = 15\text{ V}$.
- These parameters, although guaranteed, are not 100% tested in production.
- This determines the maximum value of $R_A + R_B$ for 15 V operation, the maximum total $R = 20\text{ M}\Omega$, and for 5 V operation, the maximum total $R = 6.7\text{ M}\Omega$.

Application Information

Table 1 below is the basic operating table of 555 timer.

Table 1. Basic Operating Table

| Reset (PIN 4) | V_{TR} (PIN 2) | V_{TH} (PIN 6) | Output (PIN 3) | Discharging Transistor (PIN 7) |
|------------------|---------------------|---------------------|-------------------|--------------------------------------|
| Low | X | X | Low | ON |
| High | $< 1/3 V_{CC}$ | X | High | OFF |
| High | $> 1/3 V_{CC}$ | $> 2/3 V_{CC}$ | Low | ON |
| High | $> 1/3 V_{CC}$ | $< 2/3 V_{CC}$ | Previous State | |

When the low signal input is applied to the reset terminal, the timer output remains low regardless of the threshold voltage or the trigger voltage. Only when the high signal is applied to the reset terminal, the timer's output changes according to threshold voltage and trigger voltage.

When the threshold voltage exceeds $2/3$ of the supply voltage while the timer output is high, the timer's internal discharge transistor turns on, lowering the threshold voltage to below $1/3$ of the supply voltage. During this time, the timer output is maintained low. Later, if a low signal is applied to the trigger voltage so that it becomes $1/3$ of the supply voltage, the timer's internal discharge transistor turns off, increasing the threshold voltage and driving the timer output again at high.

1. Monostable Operation

Figure2. Monostable Circuit

Figure 3. Resistance and Capacitance vs. Time Delay (t_D)

Figure 4. Waveforms of Monostable Operation

$R_A = 1k\Omega$, $R_B = 1k\Omega$, $R_L = 1kW$, $C_1 = 1\mu F$, $V_{CC} = 5V$

Figure 8. Waveforms of Astable Operation

An astable timer operation is achieved by adding resistor R_B to Figure 2 and configuring as shown on Figure 6. In the astable operation, the trigger terminal and the threshold terminal are connected so that a self-trigger is formed, operating as a multi-vibrator. When the timer output is high, its internal discharging transistor turns off and the V_{C1} increases by exponential function with the time constant $(R_A + R_B) \cdot C$.

When the V_{C1} , or the threshold voltage, reaches $2 V_{CC}/3$; the comparator output on the trigger terminal becomes high, resetting the F/F and causing the timer output to become low. This turns on the discharging transistor and the C_1 discharges through the discharging channel formed by R_B and the discharging transistor. When the V_{C1} falls below $V_{CC}/3$, the comparator output on the trigger terminal becomes high and the timer output becomes high again. The discharging transistor turns off and the V_{C1} rises again.

In the above process, the section where the timer output is high is the time it takes for the V_{C1} to rise from $V_{CC}/3$ to $2 V_{CC}/3$, and the section where the timer output is low is the time it takes for the V_{C1} to drop from $2 V_{CC}/3$ to $V_{CC}/3$. When timer output is high, the equivalent circuit for charging capacitor C_1 is as follows:

$$C_1 \frac{dv_{c1}}{dt} = \frac{V_{CC} - V(0-)}{R_A + R_B} \quad (1)$$

$$V_{C1}(0+) = V_{CC}/3 \quad (2)$$

$$V_{C1}(t) = V_{CC} \left(1 - \frac{2}{3} e^{-\left(\frac{t}{(R_A + R_B)C_1} \right)} \right) \quad (3)$$

Since the duration of the timer output high state (t_H) is the amount of time it takes for the $V_{C1}(t)$ to reach $2 V_{CC}/3$,

$$V_{C1}(t) = \frac{2}{3} V_{CC} = V_{CC} \left(1 - \frac{2}{3} e^{-\left(\frac{t_H}{(R_A + R_B)C_1} \right)} \right) \quad (4)$$

$$t_H = C_1(R_A + R_B) \ln 2 = 0.693(R_A + R_B)C_1 \quad (5)$$

The equivalent circuit for discharging capacitor C1, when timer output is low is, as follows:

$$C_1 \frac{dv_{C1}}{dt} + \frac{1}{R_A + R_B} V_{C1} = 0 \quad (6)$$

$$V_{C1}(t) = \frac{2}{3} V_{CC} e^{-\frac{t}{(R_A + R_D)C_1}} \quad (7)$$

Since the duration of the timer output low state (t_L) is the amount of time it takes for the $V_{C1}(t)$ to reach $V_{CC}/3$,

$$\frac{1}{3} V_{CC} = \frac{2}{3} V_{CC} e^{-\frac{t_L}{(R_A + R_D)C_1}} \quad (8)$$

$$t_L = C_1(R_B + R_D) \ln 2 = 0.693(R_B + R_D)C_1 \quad (9)$$

Since R_D is normally $R_B \gg R_D$ although related to the size of discharging transistor,

$$t_L = 0.693 R_B C_1 \quad (10)$$

Consequently, if the timer operates in astable, the period is the same with ' $t = t_H + t_L = 0.693(R_A + R_B)C_1 + 0.693 R_B C_1 = 0.693(R_A + 2R_B)C_1$ '

because the period is the sum of the charge time and discharge time. Since frequency is the reciprocal of the period, the following applies:

$$\text{frequency, } f = \frac{1}{t} = \frac{1.44}{(R_A + 2R_B)C_1} \quad (11)$$

3. Frequency Divider

By adjusting the length of the timing cycle, the basic circuit of Figure 1 can be made to operate as a frequency divider. Figure 9 illustrates a divide-by-three circuit that makes use of the fact that retriggering cannot occur during the timing cycle.

Figure 9. Waveforms of Frequency Divider Operation

4. Pulse Width Modulation

The timer output waveform may be changed by modulating the control voltage applied to the timer's pin 5 and changing the reference of the timer's internal comparators. Figure 10 illustrates the pulse width modulation circuit.

When the continuous trigger pulse train is applied in the monostable mode, the timer output width is modulated according to the signal applied to the control terminal. Sine wave, as well as other waveforms, may be applied as a signal to the control terminal. Figure 11 shows the example of pulse width modulation waveform.

Figure 10. Circuit for Pulse Width Modulation

Figure 11. Waveforms of Pulse Width Modulation

5. Pulse Position Modulation

If the modulating signal is applied to the control terminal while the timer is connected for the astable operation, as in Figure 12, the timer becomes a pulse position modulator.

In the pulse position modulator, the reference of the timer's internal comparators is modulated, which modulates the timer output according to the modulation signal applied to the control terminal.

Figure 13 illustrates a sine wave for modulation signal and the resulting output pulse position modulation; however, any wave shape can be used.

Figure 12. Circuit for Pulse Position Modulation

Figure 13. Waveforms of pulse position modulation

6. Linear Ramp

When the pull-up resistor R_A in the monostable circuit shown in Figure 2 is replaced with constant current source, the V_{C1} increases linearly, generating a linear ramp. Figure 14 shows the linear ramp generating circuit and Figure 15 illustrates the generated linear ramp waveforms.

Figure 14. Circuit for Linear Ramp

Figure 15. Waveforms of Linear Ramp

In Figure 14, current source is created by PNP transistor Q1 and resistor R1, R2, and R_E.

$$I_C = \frac{V_{CC} - V_E}{R_E} \quad (12)$$

Here, V_E is

$$V_E = V_{BE} + \frac{R_2}{R_1 + R_2} V_{CC} \quad (13)$$

For example, if V_{CC} = 15 V, R_E = 20 kΩ, R1 = 5 kΩ, R2 = 10 kΩ, and V_{BE} = 0.7 V,
V_E = 0.7 V + 10 V = 10.7 V, and
I_C = (15 - 10.7) / 20 k = 0.215 mA.

When the trigger starts in a timer configured as shown in Figure 14, the current flowing through capacitor C1 becomes a constant current generated by PNP transistor and resistors.

Hence, the V_C is a linear ramp function as shown in Figure 15. The gradient S of the linear ramp function is defined as follows:

$$S = \frac{V_{p-p}}{t} \quad (14)$$

Here the V_{p-p} is the peak-to-peak voltage.

If the electric charge amount accumulated in the capacitor is divided by the capacitance, the V_C comes out as follows:

$$V = Q/C \quad (15)$$

The above equation divided on both sides by t gives:

$$\frac{V}{t} = \frac{Q \text{ } \S \text{ } t}{C} \quad (16)$$

and may be simplified into the following equation:

$$S = I/C \quad (17)$$

In other words, the gradient of the linear ramp function appearing across the capacitor can be obtained by using the constant current flowing through the capacitor.

If the constant current flow through the capacitor is 0.215 mA and the capacitance is 0.02 μF, the gradient of the ramp function at both ends of the capacitor is S = 0.215 m / 0.022 μ = 9.77 V/ms.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS

Definition of Terms

| Datasheet Identification | Product Status | Definition |
